

ASSIGNMENT 10.2

NAME: B.YASHWANTH KUMAR

ENROLLMENT ID: 2503A51L42

TASK 1:

->Write python program as shown below.

->Use an AI assistant to review and suggest corrections

```
> Users > ramsa > OneDrive > Documents > ai assistant lab > AIACLAB10.1.py > ...
1  # Corrected factorial calculation function
2  def calcFact(n):
3      result = 1
4      # Factorial should multiply from 1 to n (inclusive)
5      for i in range(1, n + 1):
6          result = result * i
7      return result
8
9  def main():
10     num = 5
11     FACT = calcFact(num)
12     print("The factorial of", num, "is", FACT)
13     t = 10
14     # Compare FACT to t, not just 10
15     if FACT > t:
16         print("BIG Number")
17     else:
18         print("small number")
19
20 main()
21
22 # Comments:
23 # - The range in calcFact should be range(1, n+1) to include n.
24 # - Removed unused variable x.
25 # - In the if statement, compare FACT to t for clarity.
26 # - Improved print statements for
```

OUTPUT:

```
/ai assistant lab/AIACLAB10.1.py"
The factorial of 5 is 120
BIG Number
```

TASK 2

->Write the Python code for Fibonacci as shown below and execute.

- Ask AI to improve variable names, add comments, and apply PEP8 formatting (cleaned up).
- Students evaluate which suggestions improve readability most. one.

```
# Fibonacci series generator with improved variable names and inline comments

def fibonacci_series(n_terms):
    """Generate Fibonacci series up to n_terms elements."""
    first = 0
    second = 1
    series = [first, second]
    count = 2 # Already have two terms

    # Generate Fibonacci numbers until reaching n_terms
    while count < n_terms:
        next_term = first + second
        series.append(next_term)
        first = second
        second = next_term
        count += 1

    return series

def main():
    num_terms = 10
    fib_sequence = fibonacci_series(num_terms)
    print(f"Fibonacci series up to {num_terms} terms: {fib_sequence}")

main()
```

OUTPUT:

```
/ai assistant lab/AIACLAB10.1.py"
Fibonacci series up to 10 terms: [0, 1, 1, 2, 3, 5, 8, 13, 21, 34]
```

TASK 3

Write a Python script with 3–4 functions (e.g., calculator: add, subtract, multiply, divide).

- Incorporate manual docstring in code with NumPy Style
- Use AI assistance to generate a module-level docstring + individual function docstrings.
- Compare the AI-generated docstring with your manually written one.

Common Examples of Code Smells

- Long Function – A single function tries to do too many things.
- Duplicate Code – Copy-pasted logic in multiple places.
- Poor Naming – Variables or functions with confusing names (x1, foo, data123).
- Unused Variables – Declaring variables but never using them.
- Magic Numbers – Using unexplained constants (3.14159 instead of PI).
- Deep Nesting – Too many if/else levels, making code hard to read.
- Large Class – A single class handling too many responsibilities.

Why Detecting Code Smells is Important

- Makes code easier to read and maintain.
- Reduces chance of bugs in future updates.
- Helps in refactoring (improving structure without changing behavior).
- Encourages clean coding practices

CODE GENERATED:

```
"""
calculator_module.py

This module provides basic arithmetic operations: addition, subtraction, multiplication, and division.
Each function is documented using NumPy style docstrings for clarity and consistency.

Functions
-----
add(a, b)
| Returns the sum of two numbers.

subtract(a, b)
| Returns the difference between two numbers.

multiply(a, b)
| Returns the product of two numbers.

divide(a, b)
| Returns the quotient of two numbers. Raises ZeroDivisionError if b is zero.
"""
```

```
def add(a, b):  
    """  
    Add two numbers.  
  
    Parameters  
    -----  
    a : float or int  
        First number.  
    b : float or int  
        Second number.  
  
    Returns  
    -----  
    float or int  
        The sum of a and b.  
    """  
    return a + b
```

```
def subtract(a, b):  
    """  
    Subtract two numbers.  
  
    Parameters  
    -----  
    a : float or int  
        First number.  
    b : float or int  
        Second number.  
  
    Returns  
    -----  
    float or int  
        The difference of a and b.  
    """  
    return a - b
```

```
def multiply(a, b):  
    """  
    Multiply two numbers.  
  
    Parameters  
    -----  
    a : float or int  
    |     First number.  
    b : float or int  
    |     Second number.  
  
    Returns  
    -----  
    float or int  
    |     The product of a and b.  
    """  
    return a * b
```

```
def divide(a, b):  
    """  
    Divide two numbers.  
  
    Parameters  
    -----  
    a : float or int  
    |   Numerator.  
    b : float or int  
    |   Denominator.  
  
    Returns  
    -----  
    float  
    |   The quotient of a and b.  
  
    Raises  
    -----  
    ZeroDivisionError  
    |   If b is zero.  
    """  
    if b == 0:  
        raise ZeroDivisionError("Cannot divide by zero.")  
    return a / b
```
